

DAY 12 — LAB 12

AI Presentation Creation and Professionalism Audit

Student Name: Bhumika Mehra

Programme: BBA Aviation Management

Course: Generative AI for Business

Date: 22 September 2026

Presentation Tool Used: Gamma

PART A — CREATE THE PRESENTATION

Step 1 — Presentation Topic

Improving Passenger Experience at Airports Using Generative AI

Target Audience: Airport Management Team

Presentation Purpose:

To explain how Generative AI can support passenger-service activities while recognising its limitations and the continuing need for human review.

Step 2 — Presentation Brief

Brief Element	Student Response
Presentation title	Improving Passenger Experience at Airports Using Generative AI
Business problem	Airports handle many passenger enquiries, feedback messages and communication requirements. Staff may need to prepare information quickly and in different formats. Generative AI can assist with drafting and organising communication, but the information must be checked by authorised staff.
Target audience	Airport management team
Presentation objective	To explain suitable uses of Generative AI for passenger service and show how human review can make AI-assisted communication safer and more reliable.
Number of slides	10
Key topics	Passenger-service challenges, GenAI applications, AI-assisted workflow, flight-delay communication, benefits, risks, human review, governance and implementation recommendations.
Verified facts available	The presentation brief and the provided aviation-management lab instructions.
Information requiring verification	Current airport policies, passenger rights, operational information, statistics, financial figures, privacy requirements and organisation-specific procedures.
Visual style	Professional aviation-business theme with blue-and-white colours and realistic airport visuals.

Brief Element	Student Response
Tone	Professional, informative and responsible.
Claims that must not be made	No invented statistics, passenger numbers, financial savings, satisfaction scores, regulatory claims, policy information or operational information.

Step 3 — AI Prompt

Create a 10-slide business presentation titled “Improving Passenger Experience at Airports Using Generative AI” for an airport management audience.

Use a mechanism-first structure. Explain the business problem before discussing benefits.

Include the following:

1. Title and presentation objective
2. Current passenger-service challenges
3. Suitable Generative AI use cases
4. How the AI-assisted workflow operates
5. A flight-delay communication example
6. Expected business benefits
7. Risks and limitations
8. Human review and governance
9. Implementation recommendations
10. Conclusion and sources

Explain the workflow as:

Verified Information → Structured Prompt → AI Draft → Human Review → Approval → Passenger Communication

Do not invent statistics, financial savings, airport-performance data, passenger-satisfaction scores, regulatory claims or policy information.

Insert **[VERIFY]** wherever factual evidence, organisational data or policy confirmation is required.

Use concise bullet points and a professional blue-and-white aviation theme. Use realistic and relevant airport visuals. Do not use real airline logos, passenger data, fake charts or misleading operational information.

Step 4 — Initial Presentation Outline

Slide 1 — Title and Objective

- Improving Passenger Experience at Airports Using Generative AI
- Purpose of the presentation
- Target audience: Airport Management Team

Slide 2 — Business Problem

- Repetitive passenger enquiries
- Delayed communication
- Multilingual communication requirements
- Large volumes of passenger feedback
- Difficulty finding relevant policy information

Slide 3 — Suitable GenAI Applications

- Drafting passenger messages
- Summarising passenger feedback
- Creating FAQs
- Translating draft communication
- Generating report structures
- Supporting staff-training content

Slide 4 — AI-Assisted Workflow

- Verified Information
- Structured Prompt
- AI Draft
- Human Review
- Approval
- Passenger Communication

Slide 5 — Flight-Delay Communication

- Obtain verified flight information
- Generate a passenger-message draft
- Check facts and tone
- Remove unsupported information
- Obtain approval
- Send through an official channel

Slide 6 — Expected Benefits

- Faster preparation of first drafts
- Consistent communication structure
- Support for multiple formats
- Assistance with large amounts of text
- Staff-support material

Slide 7 — Risks and Limitations

- Hallucination
- Outdated information
- Privacy risk
- Unsupported policy claims
- Bias
- Inconsistent output

- Overreliance on automation
- Incorrect or irrelevant visuals

Slide 8 — Human Review and Governance

- Authorised data sources
- Privacy-safe prompts
- Review checklists
- Approval responsibilities
- Source verification
- Escalation of high-risk information
- Record keeping

Slide 9 — Implementation Recommendations

- Start with low-risk use cases
- Create approved prompt templates
- Train employees
- Protect sensitive information
- Establish review and approval gates
- Monitor output quality
- Maintain source verification

Slide 10 — Conclusion and Sources

- Appropriate GenAI applications
- Main limitations
- Human responsibility
- Information requiring verification
- Sources used

Step 5 — Outline Review

Outline Review Question	Yes/No	Correction Required
Is the business problem clear?	Yes	No major correction required.
Is the sequence logical?	Yes	The slides move from the problem to applications, workflow, risks and implementation.
Does the presentation explain how GenAI works in the workflow?	Yes	The verified-information-to-communication workflow is included.
Are suitable aviation use cases included?	Yes	Passenger-service examples are included.
Are risks and limitations included?	Yes	Risks such as hallucination, privacy and outdated information are included.
Is human review included?	Yes	Human review and approval are clearly explained.
Are privacy and hallucination addressed?	Yes	Both are included in the risks and governance sections.
Are unsupported figures avoided?	Yes	No unsupported statistics or financial figures are used.

Outline Review Question	Yes/No	Correction Required
Are [VERIFY] placeholders included?	Yes	[VERIFY] is used where information requires confirmation.
Is each slide focused on one main idea?	Yes	Each slide has a clear purpose and limited content.

PART B — REQUIRED SLIDE CONTENT

Slide 1 — Improving Passenger Experience at Airports Using Generative AI

Objective:

To understand how Generative AI can support airport passenger-service activities while maintaining human review and verification.

Student: Bhumika Mehra

Programme: BBA Aviation Management

Course: Generative AI for Business

Date: 22 September 2026

Slide 2 — Business Problem

Airports manage many passenger-service activities and communication requirements.

- Repetitive passenger enquiries
- Delayed communication
- Multilingual communication requirements
- Large volumes of passenger feedback
- Difficulty finding relevant policy information

Note: These challenges may differ between airports and organisations.

Slide 3 — Suitable GenAI Applications

Generative AI can support passenger-service teams by:

- Drafting passenger messages
- Summarising passenger feedback
- Creating frequently asked questions
- Translating draft communication
- Generating report structures
- Supporting staff-training content

[VERIFY] Organisation-specific use should follow approved policies and procedures.

Slide 4 — AI-Assisted Workflow

**Verified Information → Structured Prompt → AI Draft → Human Review → Approval
→ Passenger Communication**

Verified Information:

Use information from an authorised and reliable source.

Structured Prompt:

Provide the AI with the relevant verified information and clear instructions.

AI Draft:

GenAI prepares a draft message or content.

Human Review:

An authorised employee checks the facts, tone and completeness.

Approval:

The responsible person approves the final communication.

Passenger Communication:

The approved information is sent through an official communication channel.

Slide 5 — Flight-Delay Communication

Example: AI-Assisted Passenger Communication

1. Verified flight information is obtained from an authorised system.
2. GenAI creates a passenger-message draft.
3. An airline or airport employee checks the facts and tone.
4. Unsupported information is removed.
5. An authorised person approves the message.
6. The approved message is sent through an official channel.

Important: GenAI should not independently decide or invent the flight status, delay reason, compensation, gate information or revised departure time.

Slide 6 — Expected Benefits

Generative AI may support passenger-service teams by providing:

- Faster preparation of first drafts
- More consistent communication structure
- Support for multiple formats
- Assistance with large volumes of text
- Improved availability of staff-support material

Important: These are potential benefits. Guaranteed savings, accuracy or productivity improvements should not be claimed without evidence.

Slide 7 — Risks and Limitations

Important risks include:

- **Hallucination:** AI may generate information that is not supported by facts.
- **Outdated information:** AI may not have the latest operational information.
- **Privacy risk:** Sensitive passenger information should not be entered into unsafe systems.
- **Unsupported policy claims:** AI may incorrectly describe policies.
- **Bias:** AI-generated content may contain unwanted bias.
- **Inconsistent output:** Similar prompts may produce different results.
- **Overreliance on automation:** Staff may rely too heavily on AI.
- **Incorrect visuals:** AI-generated images may contain unrealistic or misleading details.

Slide 8 — Human Review and Governance

Safe AI-assisted communication should include:

- Use of authorised data sources
- Privacy-safe prompts
- Review checklists
- Clear approval responsibilities
- Source verification
- Escalation of high-risk information
- Record keeping where required

Key principle: AI can assist employees, but human staff remain responsible for reviewing important business communication.

Slide 9 — Implementation Recommendations

Airports can consider the following steps:

- Begin with low-risk use cases.
- Develop approved prompt templates.
- Train employees to use GenAI responsibly.
- Protect sensitive information.
- Establish review and approval gates.
- Monitor output quality.
- Maintain a source-verification process.

Slide 10 — Conclusion and Sources

Conclusion

Generative AI can assist airport passenger-service teams with drafting, summarising, translation and other communication tasks.

However, AI-generated information can contain errors, outdated information or unsupported claims.

Human review, source verification, privacy protection and approval processes are therefore important before AI-generated content is used for business communication.

Sources

- Instructor-provided Lab 12 instructions
- Authorised organisational information, where available
- Official sources used for any verified claims
- Gamma / Canva for AI-assisted presentation creation

PART C — CONTENT-ACCURACY AUDIT

Slide	Main Claim	Source Available?	Status	Action Required
1	GenAI can support passenger-service activities.	Yes	Supported	Keep with appropriate wording.
2	Airports may face passenger-service communication challenges.	Yes	Supported	Present as common examples, not as a claim about every airport.
3	GenAI can assist with passenger messages, summaries and FAQs.	Yes	Supported	Keep and verify organisation-specific use.
4	AI-assisted work should include human review.	Yes	Supported	Keep the workflow.
5	GenAI can draft flight-delay communication.	Yes	Supported	Ensure flight information comes from an authorised system.
6	GenAI may provide communication-support benefits.	Yes	Supported	Do not claim guaranteed savings or productivity.
7	GenAI has risks such as hallucination, privacy risk and outdated information.	Yes	Supported	Keep the risk section.
8	Human review and governance are required for responsible use.	Yes	Supported	Keep review and approval responsibilities clear.
9	Organisations should begin with low-risk use cases and monitor output.	Yes	Supported	Present as implementation recommendations.
10	AI-generated presentations should be reviewed before business use.	Yes	Supported	Include source-verification reminder.

PROFESSIONALISM AUDIT

Rating Scale

- 1 = Very Poor
- 2 = Poor
- 3 = Acceptable
- 4 = Good
- 5 = Excellent

Professionalism Criterion	Score	Comments
Logical slide sequence	5	The presentation follows a clear problem-to-solution structure.
Clear slide titles	5	Each slide has a clear and relevant title.
Readable font size	4	Text is readable with limited content on each slide.
Appropriate amount of text	4	Bullet points are concise and focused.
Consistent colours	5	Blue-and-white aviation theme is used consistently.
Consistent fonts	5	Fonts are kept consistent throughout the presentation.
Relevant visuals	4	Airport and passenger-service visuals are relevant to the topic.
Visual alignment	4	Content and visuals are arranged clearly.
Professional tone	5	Language is professional, informative and responsible.
Sources included	4	Sources and verification requirements are included.
Overall business suitability	5	The presentation is suitable for an airport-management audience.

VISUAL AUDIT

Visual Review Question	Yes/No	Action Required
Is the visual relevant to the slide?	Yes	Keep relevant visuals.
Is the airport or aircraft representation realistic?	Yes	Keep realistic aviation visuals.
Does it contain unreadable or invented text?	No	No action required.
Does it contain an unauthorised logo?	No	Do not use real airline logos.
Does it display personal information?	No	Ensure no passenger data is shown.
Does it show unsafe passenger behaviour?	No	Remove any unsafe or misleading visual.
Could it mislead the audience?	No	Check visuals before final export.
Does it improve understanding?	Yes	Keep visuals that support the slide message.

FAKE CHARTS AND FIGURES CHECK

The presentation was checked for unsupported charts and figures.

Issues to check:

- Unverified percentages
- Invented passenger numbers
- Unsupported cost savings
- Fake satisfaction scores

- Unverified growth rates
- Missing data sources

Action Taken:

No unsupported numerical claims should be presented as factual information. Any AI-generated chart or figure without a reliable source should be removed.

Where numerical data is not available, it should be replaced with:

- A process flow
- A conceptual diagram
- A qualitative comparison
- A **[VERIFY DATA]** placeholder
- A verified chart based on supplied data

SEVERITY × RISK TRIAGE

Severity

- **Low:** Minor formatting or wording problem
- **Medium:** Confusing, incomplete or weak content
- **High:** Incorrect, misleading, private or policy-sensitive information

Risk

- **Low:** Unlikely to cause harm
- **Medium:** May cause misunderstanding
- **High:** May cause operational, legal, financial, safety or reputational harm

Problem	Severity	Risk	Required Action
Minor font inconsistency	Low	Low	Correct during final formatting.
Text-heavy slide	Medium	Low	Reduce and restructure content.
Unsourced statistic	High	High	Remove or verify.
Incorrect baggage-policy statement	High	High	Replace with verified information.
Unauthorised airline logo	Medium	Medium	Remove.
Passenger information displayed	High	High	Remove immediately.
Unreadable AI-generated text	Medium	Medium	Replace or edit the visual.
Missing source	Medium	Medium	Add a verified reference.
Unsupported AI-generated statistic	High	High	Remove or verify before use.
Excessive text on a slide	Medium	Low	Shorten the content and use bullet points.
Misleading airport visual	Medium	Medium	Replace the visual with a relevant image.

BEFORE-AND-AFTER COMPARISON

Slide	Initial Problem	Revision Made	Why the Revised Slide Is Better
Slide 2	The initial slide contained too much general information about passenger problems.	Reduced the content to five clear passenger-service challenges.	The main business problem is easier to understand.
Slide 5	The initial workflow did not clearly show the responsibility of human staff.	Added the six-step verified-information-to-passenger-communication workflow.	It clearly explains the role of AI and human review.
Slide 7	The initial risk section was too general.	Added specific risks such as hallucination, privacy risk, outdated information and overreliance on automation.	The audience can understand the main risks more clearly.

Screenshots:

Insert screenshots of the initial and revised versions of Slides 2, 5 and 7 here.

STUDENT REFLECTION

1. How did Gamma or Canva assist in creating the presentation?

Gamma assisted in creating the initial presentation structure, arranging the content and designing the slides. It helped save time in preparing the basic layout and visual presentation. However, the generated content still required human checking and editing.

2. Which part required the most human judgement?

The most human judgement was required when checking whether the information was accurate and suitable for an airport-management audience. Decisions about risks, verification, privacy and human approval required careful review.

3. Did the tool generate any unsupported facts or figures?

The presentation was checked for unsupported facts and figures. Any statistics, financial savings, passenger numbers or other information without a reliable source were treated as requiring verification or were removed.

4. Did you identify any fake or weak charts?

Yes. AI-generated charts can appear professional even when the underlying data is not available. Therefore, unsupported charts and figures were removed or replaced with conceptual diagrams and process flows.

5. What was the highest-risk issue in the initial draft?

The highest-risk issue was the possibility of presenting unsupported or incorrect operational information as fact. In aviation, incorrect information could create confusion for passengers or staff, so important information must be verified.

6. How did the professionalism audit improve the presentation?

The professionalism audit helped improve the slide sequence, readability, font consistency, colour consistency, visual relevance and overall business presentation. It also helped identify areas that needed editing.

7. How did severity × risk triage help prioritise corrections?

Severity × risk triage helped identify which problems needed immediate attention. High-severity and high-risk problems, such as incorrect policy information or passenger information exposure, were given greater priority than minor formatting issues.

8. What changes did you make to the visuals?

Irrelevant visuals were removed and replaced with realistic airport-related visuals. Unauthorised logos, personal information and misleading images were avoided. The visuals were also checked for readability and relevance.

9. Which slide required the greatest improvement?

Slide 5 required the greatest improvement because the AI-assisted workflow needed to clearly explain the responsibility of human staff. The revised slide shows the complete process from verified information to final passenger communication.

10. Why must an AI-generated presentation be reviewed before business use?

An AI-generated presentation must be reviewed because AI can produce incorrect, outdated or unsupported information. Human review helps verify facts, protect privacy, remove misleading information and ensure that the final presentation is suitable for business use.

AI USAGE DECLARATION

Gamma, Canva, ChatGPT and/or Google Gemini were used to assist with the presentation outline, content or design. I independently verified the claims, reviewed the visuals, removed unsupported information, revised the presentation and completed the reflection.
